Care Instructions

After your car was treated with Nanolex Paint & Alloy Sealant please keep in mind:

Your car will still become dirty at some point – but it is now much easier to clean it because dirt just can't stick to the surface as before.

You don't need as much cleaners as before, also the cleaners that you use don't need to be very harsh to remove all the dirt that has settled on the surface.

This is why we'd like you to consider the environment and not to use harsh chemicals.

Important facts:

1. The sealed surfaces should not be covered with other products such as wax or polymer sealants. Those products cover the sealant layer and thereby the easy-to-clean effect that it provides.
Please also keep in mind that abrasive polishes will remove the sealant.
2. Too make sure the sealant has maximum durability and performance please be advised:
 - In general we recommend to always wash the car by hand using Nanolex Reactivating Shampoo. This way the condition of your paint will be preserved since much less micro-scratches will be inflicted, also Nanolex Reactivating Shampoo will guarantee that the sealant layer is preserved, it will even add performance and durability to it. If you wash the car the by hand, please make sure that you are always using a high quality wash mitt and drying towels to make sure that scratches and marring is avoided as far as possible.
If the car is cleaned in automated car washes make sure that soft textiles are used for cleaning to avoid major damage to the cars paint and wheels.
 - It is not necessary to use dedicated wheel cleaners – the sealant on the wheels makes them much easier to clean – Nanolex Reactivating Shampoo or other mild cleaners will absolutely suffice to clean the wheels completely and gently.
